SERIAL CABLE CONFIGURATION

Video Wall Wiring Configurations - Screen Control SW

Caution

• Before the operation of this program, user need to confirm the connection between the computer (which has Screen-Control program) and monitors

Computer

Screen-Control Software installed

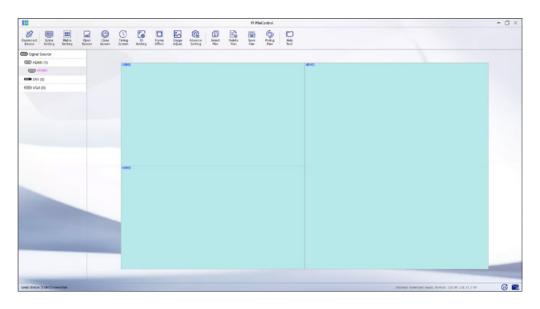

Launch the program

- Find the 'M-MixControl' program and double click to launch it.
- First of all, check the user account is the **video control system**. The other account (video processor terminal) is not working on this system.

Deafult ID / Password: Video control system / 123321

Λ

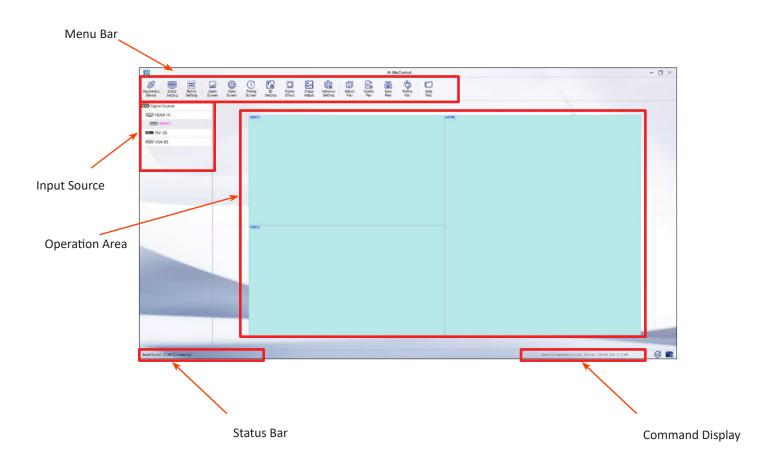

Caution

- This program is portable and does not require to install onto PC.
- If you cannot run program, please check provided CD/USB to run 'M-MixControl' program.
- If you can launch the program, first of all, you need to connect RS232 serial cable(RJ45) between monitor and computer (which run MixControl program).
- RJ-45 to DP9 converter & converter driver is included in CD/USB.

Launch the program - Interface

- General and Advance settings are different.
- Administrator interface consists of six parts: menu bar, input source, operation area, administrator tool bar (additional function bar), command display and status bar.
- General User can see 5 parts except administrator tool bar

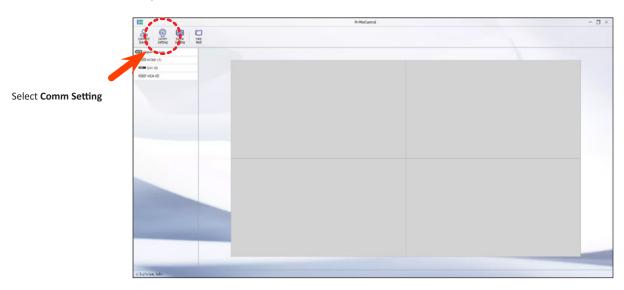

- Menu bar Video wall system control
- Input Source Display the current input source
- Operation area Allow to control each monitor
- Status bar Display the current status of program
- Command display Display the ASCII code command for monitors

Menu Bar - Comm Setting

Before starting program, user should check Comm Setting (Communication Setting). Please check the connection between the computer and the monitor via RJ-45, RJ-45&RS-232 Converter and RS-232.

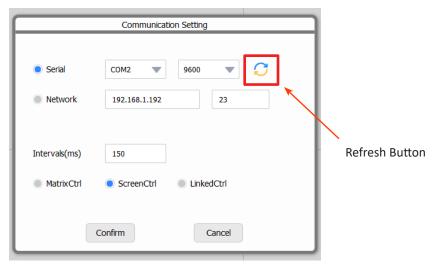

Caution : Comm Setting should be done before **Open Connect** (Tool bar) button click. The **Comm Setting** cannot be edited after Open Connect - connected status.

Main window

Menu Bar - Comm Setting

Communication Setting window

- Serial port connection: Select "Serial (Serial port connection)" to set the COM port and baud rate to be connected.
- Network connection: Select "Net (Network Connection)" and set the IP address and port number to be connected - Not support for VZ-UNBS
- Intervals (ms): Default number is '150ms' and this value is the waiting time after each command.
- ScreenCtrl: Control 'Splicing Screen System' for video wall monitors
- MatrixCtrl: Control 'Matrix' for video wall monitors Not support for VZ-UNBS
- LinkedCtrl: Control both 'Matrix and Splicing Screen System' for video wall monitors Not support for VZ-UNBS
- Click the **Refresh** button before set it up, and then input proper info or select it.
 - ▶ The provided cable (RJ45 connector type) can use the serial communication. We recommend to use this cable for communication between comptuer and UNBS monitors.
 - ► How do I know which COM number to choose?
 - Computer serial port info: you can check this at Computer Window (which run this program) and then Right-click "My Computer" → "Management" → "Device Manager" → "Port (COM and LPT)" → USB Serial Port (COM)
 - Check the relevant serial port number of the computer and compare it with **Communication setting** window.
 - ▶ If you have a correct connection via serial cable, Serial port connection info will show COM info automatically.

▲ Caution: The (Communication) Connection should be connected by provided tools (RJ-45 & RJ-45 to RS232 converter). Or user can make own serial cable based on given info (please refer to ViewZ UNBS User Manual.)

To use converter, user need to install the converter driver on the computer (which Video wall program installed). The converter driver (Prolific USB-to-Serial) is included in the CD/USB.

Menu Bar - Splice Setting

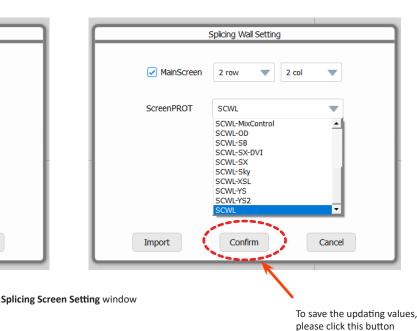

- If you correctly setup on Com Setting, you shoulde type the correct monitor number to 'Splice Setting.'
- Click Splice Setting on menu bar
 - Row (Vertical number of monitors) manually select the number (Max 15)
